PORTFOLIO
IMMORTALIZED

YOUR STORY.
YOUR LEGACY.

PROTECTED FOR TOMORROW.

A secure digital home for important documents, family videos and messages - with trusted people and carefully controlled future access.

PRODUCT BLUEPRINT & FEATURE GUIDE

Prepared for discussion with interested parties

PIE CORP LIMITED | CONCEPT DOCUMENT | OCTOBER 2026

01 / INTRODUCTION

A safe home for your legacy

Portfolio Immortalized is a secure digital legacy platform designed to help people preserve important documents, videos, voice messages and personal instructions, then control how selected items may be shared with trusted people in the future.

The platform combines a mobile-first experience with a supporting web service. People can start with a simple account, build their profile over time, organize a private vault, appoint trustees and beneficiaries, and leave instructions that can be acted on only through a carefully reviewed process.

The promise

Your story. Your legacy. Protected for tomorrow. Portfolio Immortalized gives people a clear way to organize what matters, while keeping privacy, choice and human oversight at the centre.

What this guide is for

This product blueprint is written for prospective partners, advisors, stakeholders and people interested in understanding the experience. It explains what the app is intended to do and how its main journeys should feel. It is not a legal opinion or a low-level engineering specification.

The product at a glance

Pillar	What it means for the user
Preserve	Upload signed wills, scans, records, photographs, videos and voice messages.
Organize	Keep items in one private vault with clear names, categories and versions.
Choose	Select trustees, beneficiaries and who may receive each item.
Prepare	Save instructions and recovery arrangements before they are needed.
Verify	Use trustees, evidence, review steps and administrator oversight for sensitive cases.
Release carefully	Provide access only after the required checks and independent approvals.

02 / THE OPPORTUNITY

Why a digital legacy platform?

Important documents and personal memories are often scattered across phones, email inboxes, paper files, hard drives and cloud accounts. Even when family members know that something exists, they may not know where it is, which version is current or how they are meant to access it.

The challenges Portfolio Immortalized addresses

- Lost or inaccessible records: important documents may be misplaced, damaged or stored on a device no one can unlock.
- Unclear instructions: family members may not know which items were intended for them or whom to contact.
- Uncontrolled sharing: sensitive files should not be distributed by an ordinary public link or a casual forwarding action.
- Uncertain future access: a platform needs a clear, fair and auditable process for reviewing reports and authorizing release.
- Overwhelming setup: users need to be able to start simply and add more information when ready.

Our response

Portfolio Immortalized brings those activities into one place: a private digital vault, a trusted network, personal legacy instructions and an accountable release process. The user remains in control while alive, and the platform adds checks before any exceptional access is granted.

Design principle

The experience should feel calm and understandable. The seriousness of the information should be reflected in the safeguards, not in a confusing interface.

03 / WHO IT SERVES

Four roles, one connected service

Role	What they do	What they should be able to see
Account holder	Builds the vault, manages their profile, appoints trusted people and sets item-by-item instructions.	Their own profile, their own items, their own network and relevant security activity.
Trustee	Accepts an invitation and helps verify a status report or submit evidence when requested.	Only the assigned account/case information needed for the trustee role.
Beneficiary	Verifies identity and receives access to items assigned to them after an authorized release.	Only the specific legacy items and instructions assigned to them.
Administrator	Monitors platform health, investigates cases, responds to security alerts and manages authorized decisions.	Operational account and case data according to a role-based permission level.

The principle behind the roles

No one should automatically receive access to everything. A trustee helps protect the process; a beneficiary receives only what the account holder assigned to them; and an administrator manages the platform without routinely opening private documents.

A note about administrators

Administrative actions are themselves recorded. Sensitive release decisions should be separated from case initiation and require independent authorization.

04 / THE JOURNEY

From first sign-up to secure release

High-level experience map. The exact timing and verification rules will be configured and legally reviewed before launch.

A simple starting point

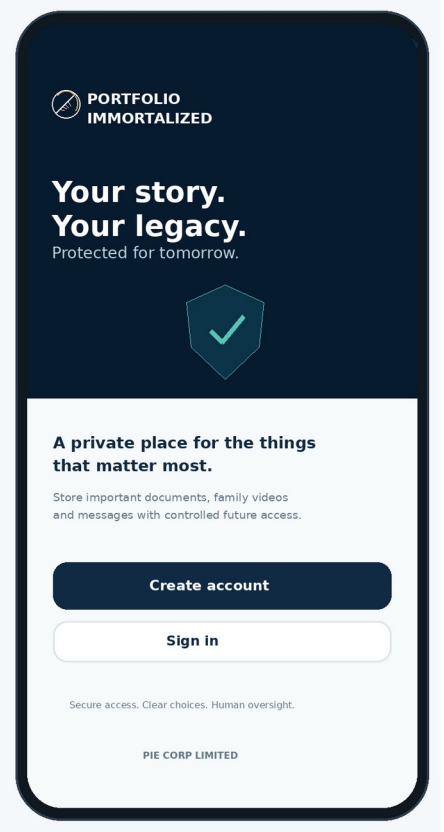

Users do not need to complete every personal detail during sign-up. They can create an account with basic information, verify their contact method and continue into the app. Profile details, trustees, beneficiaries and legacy instructions can be added as part of a guided setup checklist.

A carefully controlled end point

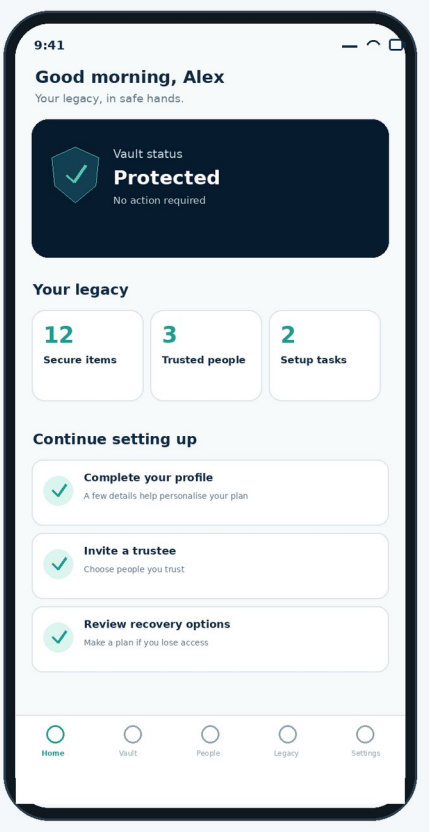

A legacy item does not become available just because a person has been inactive. Inactivity may prompt reminders and an investigation; supporting evidence, trustee review, owner notifications, a safety hold and the required administrator approvals must be completed before the release service grants access.

05 / GETTING STARTED

Start simple. Complete the plan over time.

01 Welcome and account entry

02 Home dashboard and setup checklist

The onboarding experience

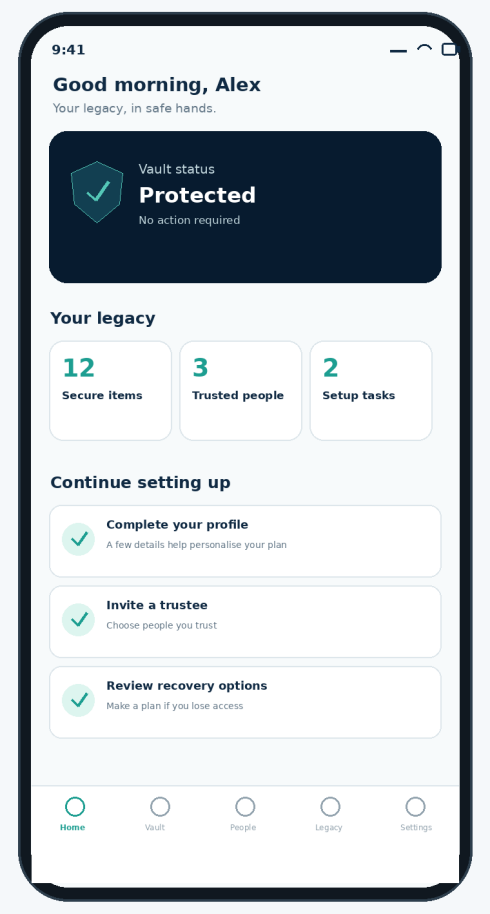

- Create an account with basic details and a verified email address or other supported authentication method.
- Choose a secure login method; biometric app unlock can be enabled on supported devices.
- Enter the dashboard without being forced to fill in every profile, trustee and beneficiary field immediately.
- Follow a checklist to complete profile details, trusted contacts, recovery arrangements and legacy instructions when ready.

Why this matters

A shorter first session makes the app easier to adopt. Clear progress indicators encourage users to complete the important steps without making registration feel like a legal questionnaire.

06 / HOME

A reassuring home dashboard

Conceptual mobile dashboard. Names, numbers and activity are illustrative.

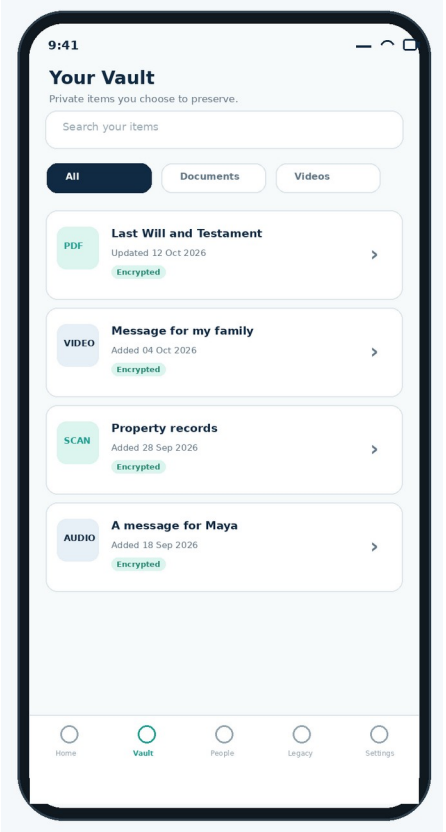

What the home screen communicates

Area	Purpose
Vault status	Shows whether the account is protected and whether any security or setup action is needed.
Your legacy	Quick access to saved items and the people connected to the plan.
Setup checklist	Prompts the user to complete a profile, invite trustees or review recovery options.
Recent activity	Shows recent uploads, relationship changes and important security events.
Notifications	Presents relevant reminders and updates without exposing sensitive contents on the lock screen.

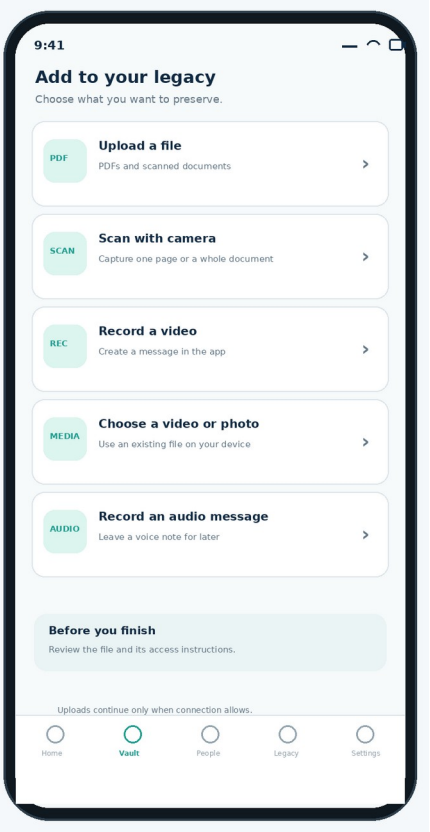

The dashboard will not ask users to press an “I Am Alive” button. The service may record meaningful, verified account activity, but lack of activity is treated as uncertainty rather than proof of death.

07 / THE DIGITAL VAULT

One private place for important items

03 Browse the vault

04 Add a document or recording

Types of items users can preserve

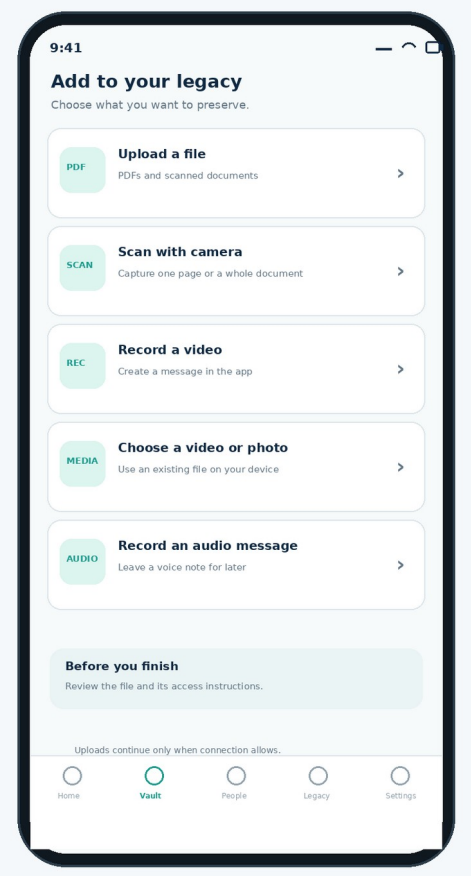

Item type	Examples
Legal documents	Signed will PDFs, scanned wills, formal letters and supporting records.
Identity and records	Identity scans or other documents the user chooses to store securely.
Photos and personal files	Private photographs, records and useful reference material.
Video messages	Existing videos or new recordings made in the app.
Voice and written messages	Voice notes, letters and recipient-specific messages.
Other legacy material	Additional supported file types, with clear size and safety limits.

Originals are preserved

The experience should distinguish the original uploaded document from any preview or watermarked copy created for a recipient. The system records file integrity and relevant version history.

08 / CAPTURE AND UPLOAD

Upload, scan or record in the moment

Conceptual upload menu with multiple ways to preserve material.

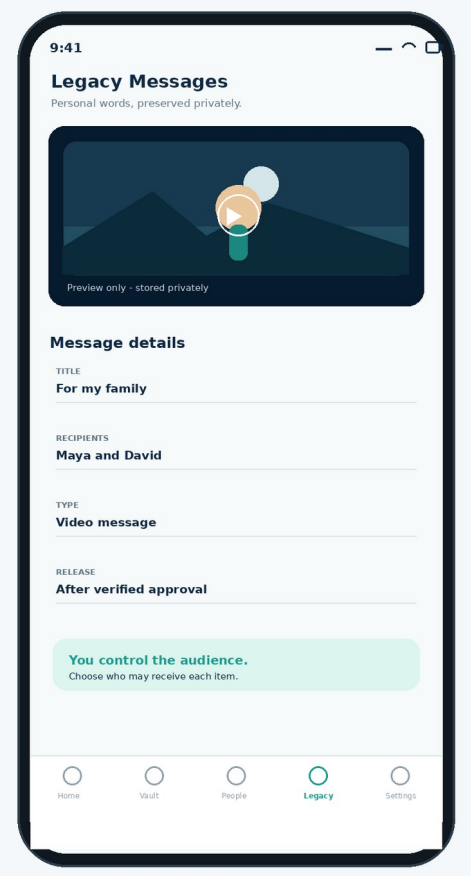

The upload flow

Step	What the user experiences
Choose a source	Pick a file from the device, capture a scan, record a video or record an audio message.
Review	Preview the document or media, rename it and check that it is complete and readable.
Describe	Add a title, category, short note and optional intended recipients.
Protect	The application prepares the file for private, encrypted storage and applies access rules.
Confirm	A clear status shows whether saving is complete, in progress or waiting for connection.

For document scans, users should be able to capture multiple pages, crop or rotate them, reorder pages and save the result as a PDF. For large videos, the app should support upload progress and recovery after network interruptions.

09 / MESSAGES FOR THE FUTURE

Leave a message in your own words

Conceptual screen for reviewing a private video message and its assigned recipients.

Personal legacy content

Not every legacy item is a legal document. People may want to leave a recorded message, family story, voice note, photograph collection or personal letter for a specific person. Portfolio Immortalized is designed to let users organize these items intentionally rather than treating every file as part of one undifferentiated package.

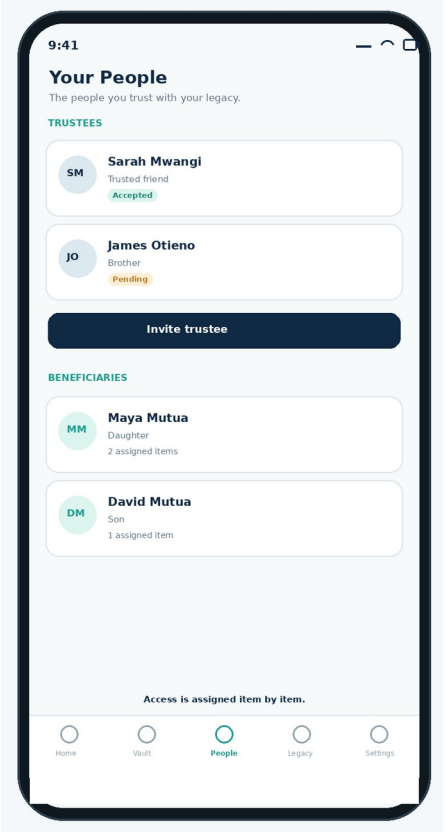

- Assign a specific item to one or more chosen recipients.
- Add instructions or context for the recipient.
- Preview the message and change its title or recipient assignment while authorized.
- Keep personal content private until the relevant access conditions are satisfied.
- Clearly distinguish the account holder’s original recording from any generated transcript or caption.

User choice

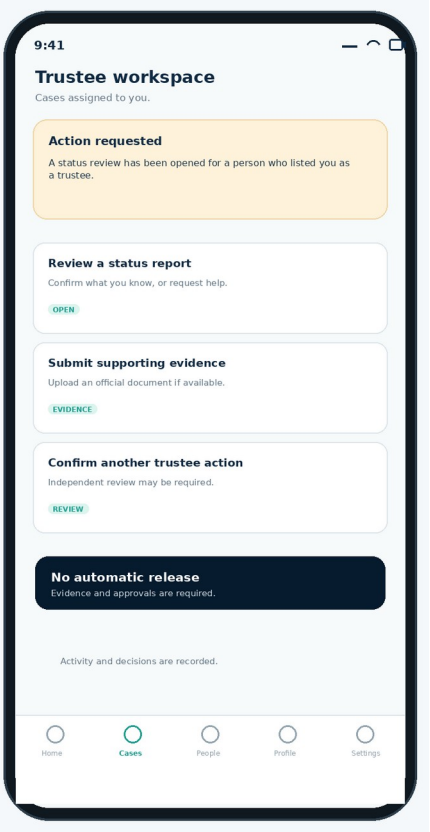

AI-assisted transcription or captions may be offered as optional features. They should never silently replace or alter the original recording.

10 / PEOPLE AND PERMISSIONS

The trusted network

05 Trustees and beneficiaries

06 Trustee case workspace

Trustees and beneficiaries have different jobs

Trustees	Beneficiaries
Help verify a report, submit supporting evidence, confirm a separate trustee action where required and respond to a case request.	Receive access to items specifically assigned to them after identity verification and an authorized release.
Must accept the invitation and verify their account before being considered active.	Can be added before they create an account; identity and access are verified when needed.
Do not automatically gain access to the will or private videos.	Do not automatically gain access to the entire vault.

The account holder can add more information to their own profile and network over time. High-risk changes, including replacing trustees or changing who receives a will, should trigger additional verification and an audit entry.

11 / VERIFICATION AND RELEASE

A careful process, not an automatic assumption

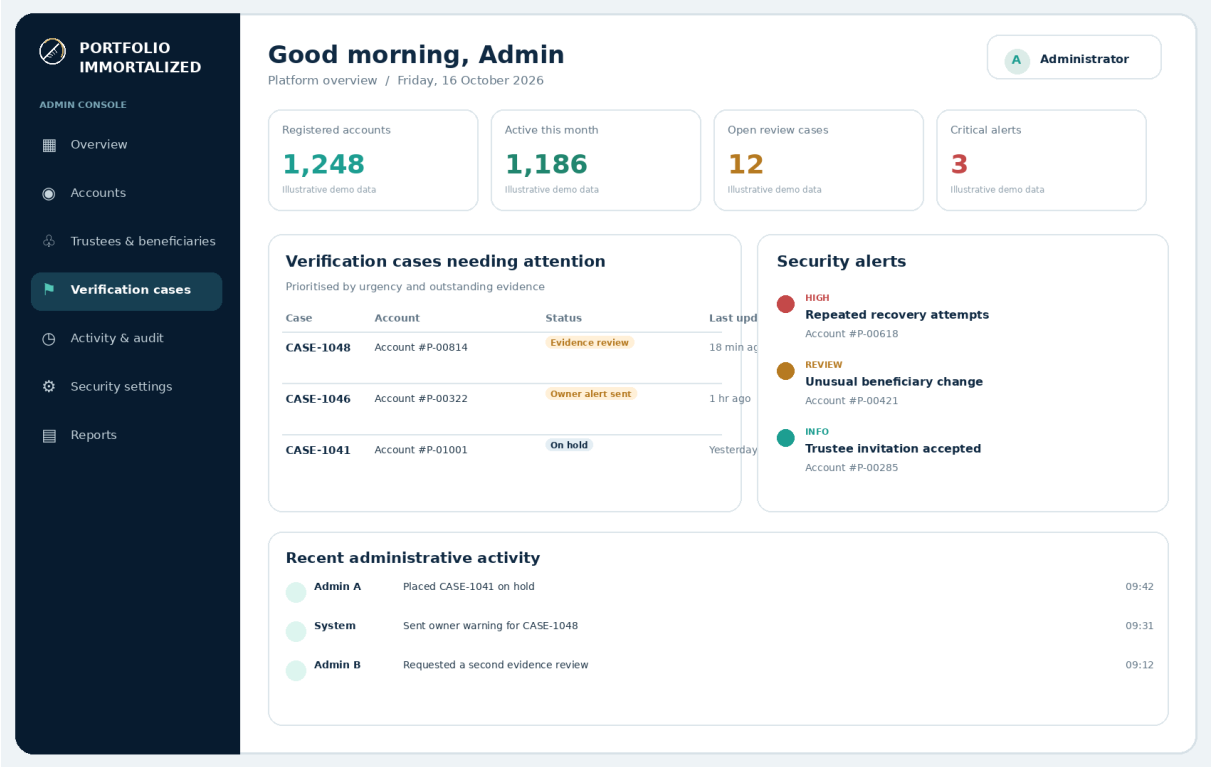

Stage	What happens	What does not happen
1. Inactivity noticed	Reminders and an investigation workflow may begin after the configured period.	Inactivity does not declare the person dead.
2. Trustees contacted	Assigned trustees are asked to review the situation and provide any relevant information.	A single unattended notification does not authorize release.
3. Evidence gathered	Supporting documents and confirmations are recorded in a case.	AI does not decide that a death certificate is genuine.
4. Owner safeguards	Registered channels are used for alerts; required hold periods and dispute checks apply.	A release cannot bypass an active hold or unresolved concern.
5. Human review	Authorized staff review the case and the policy checklist.	Case initiation and final approval are not the same permission.
6. Secure delivery	Eligible beneficiaries verify identity and receive only their assigned items.	A general public link does not unlock the vault.

Important safeguard

If evidence conflicts, the owner responds, a dispute is raised or security appears compromised, the release process must be suspended and reviewed. Timing, evidence standards and approvals require legal and operational approval before launch.

12 / ADMINISTRATOR CONSOLE

Operational visibility and responsible control

Illustrative desktop Admin Console. Sample counts, case IDs and alert details are fictional UI data.

Pie Corp Limited needs an administration interface for monitoring platform activity, managing accounts, responding to alerts and overseeing exceptional access cases. It should be designed for desktop use, with selected urgent actions available through secure notification workflows.

Core admin modules

Module	Capabilities
Overview	Account totals, active accounts, open review cases, critical alerts and recent administrative activity.
Accounts	Search accounts, review status, suspend or restore access, revoke sessions and initiate approved deletion workflows.
Network management	Handle trustee and beneficiary corrections or removals with a reason and appropriate authorization.
Verification cases	View case timelines, evidence checklists, owner notifications, holds and outstanding approvals.
Security & audit	Review access and security events, administrative changes, release attempts and audit history.
Operations & reports	Monitor upload failures, notification delivery, backup status, case workload and system health.

13 / CASE REVIEW CONTROLS

Administrators can intervene - with accountability

Illustrative case review interface. Final control labels and approval thresholds will be confirmed in the operational policy.

Four different actions

Action	Effect
Open an investigation	Creates a case and starts the review process. It does not grant beneficiary access.
Place a hold	Stops new release grants while the issue is investigated. Existing credentials may also need revocation.
Approve or reject a case	Records a decision and rationale after reviewing the required evidence.
Initiate a release review	Allows an authorized administrator to start an exceptional case, but never to bypass required checks and final approvals.

Two-person control

The recommended design separates the case reviewer from the final release approver. One person cannot silently approve their own request. Emergency holds should be immediate; disclosure should require more checks than suspension.

What else the admin team can do

Protect accounts

Suspend a suspected compromised account, revoke sessions, request renewed verification and restore access after review.

Manage network records

Correct or remove trustees and beneficiaries under defined permissions, with a reason and a record of the change.

Handle investigations

Assign a case owner, request additional evidence, track deadlines and record the rationale behind decisions.

Monitor communications

Check email and push-notification delivery, resend valid invitations and manage approved templates.

Monitor storage and backups

Track failed uploads, backup freshness, recovery tests, storage availability and background task failures.

Manage privacy requests

Coordinate data access, correction, retention and deletion workflows, including legal holds when necessary.

Review trends

Track onboarding completion, trustee acceptance, upload failures, case turnaround time and service reliability.

Manage administrator access

Assign individual staff roles, review privileged activity and ensure a second approver is available.

Deletion is not a casual action

Account closure should begin with a reversible state and a retention check. Records needed for a pending case, dispute, audit or legal obligation must not be destroyed simply because an account is closed.

15 / HELPFUL AI, UNDER CONTROL

Where AI adds real value

AI is intended to assist users and staff with repetitive or information-heavy tasks. It is not a substitute for consent, security checks, professional legal advice or a human decision about death and release.

AI use	Example value	Control
In-app assistant	Explains features, upload steps, trustee invitations and recovery options.	Uses approved help content; escalates sensitive cases.
Document organization	Suggests a type or filename for a new upload.	User confirms the suggestion before saving.
Scan quality	Flags blurry images, missing-page possibilities or rotated scans.	User reviews the scan; no legal validity claim.
Case summarization	Produces a draft timeline and list of outstanding evidence.	Authorized reviewer verifies every important fact.
Evidence discrepancy support	Highlights possible differences in names or dates.	Human checks source documents; AI cannot approve.
Activity anomaly support	Helps explain unusual patterns or group related alerts.	Deterministic security rules and human triage remain primary.
Media accessibility	Creates optional transcripts or captions for user-selected media.	Explicit permission; the original file remains unchanged.

What AI will not do

It will not determine that a person is dead, automatically release a will, change beneficiaries, delete an account, access encryption keys or execute privileged administrative actions.

Small assistance, at the right moment

Moment	What the assistant might say
First upload	“This looks like a PDF document. Would you like to label it as a will, a supporting record or something else?”
Poor-quality scan	“Some text near the bottom of page 2 may be hard to read. Would you like to retake that page?”
Trustee setup	“A trustee helps with a future verification process. They do not automatically get access to the files in your vault.”
Case review	“The name on the uploaded document appears different from the account record. Please compare the originals before continuing.”
Family video	“Would you like to create a transcript for accessibility? Your original recording will remain unchanged.”

Behind the scenes

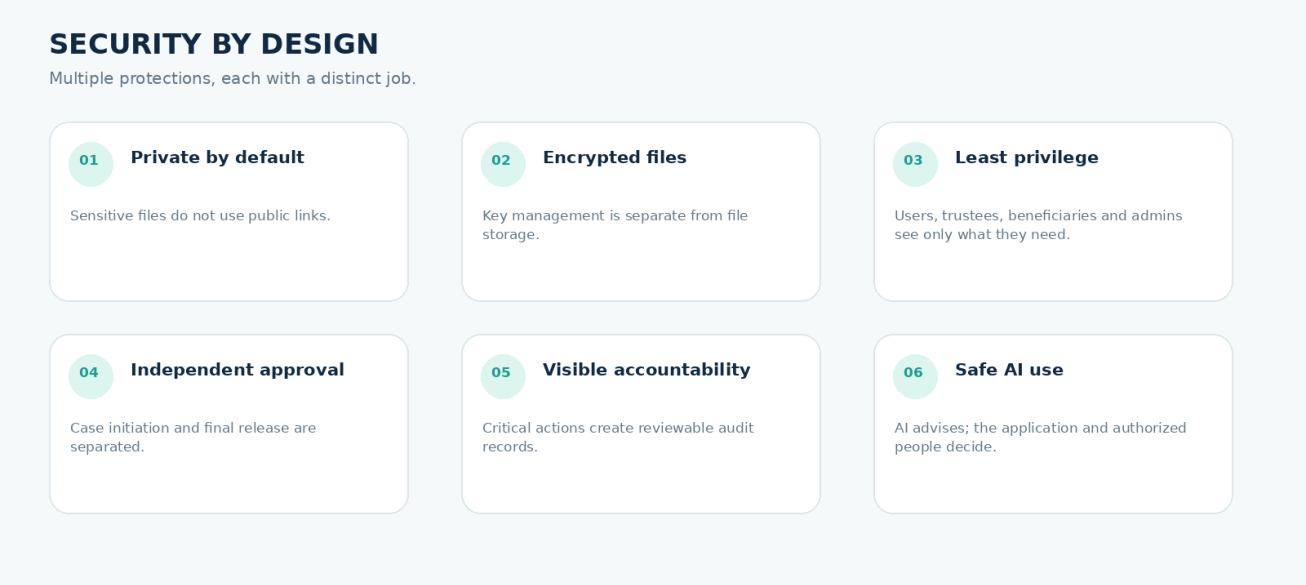

- An AI gateway decides which approved task may be sent to a provider such as Gemini or Claude.
- Only the minimum necessary data should be shared, and sensitive files are not submitted by default.
- Provider access, retention and processing terms must be reviewed before production use.
- AI results are suggestions with a processing record, not trusted system facts.
- Users and administrators should be told when AI-generated summaries, transcripts or suggestions are being shown.

AI is an assistant, not a gatekeeper

The application’s access rules, evidence requirements, authorized people and audit trail remain in charge of sensitive actions.

17 / TRUST AND PRIVACY

Security should be visible in the experience

Security principles proposed for the product. Final security design requires independent technical review.

What users should be able to understand

Protection	Plain-language meaning
Private storage	Sensitive documents should not be exposed through public asset links.
Encryption	Files should be encrypted, with key management designed separately from storage access.
Secure login	Users can use strong authentication and device-supported biometric unlocking where available.
Limited access	Trustees, beneficiaries, support staff and administrators each have a restricted role.
Account recovery	Lost devices or credentials can be handled through an intentional recovery process.
Accountability	High-risk changes, investigations and releases create reviewable records.
Human verification	Automated signals start a review; they do not independently authorize release.

The proposed storage design distinguishes confidential wills and identity documents from ordinary public media. Cloudinary may be used for approved non-sensitive media; restricted legal files require private storage and encryption appropriate to their risk.

18 / NOTIFICATIONS

Clear communication, without exposing private details

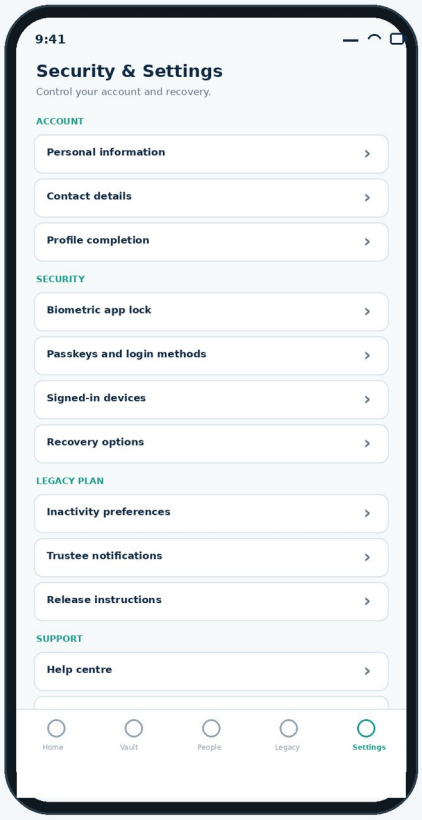

Event	Example notification	Purpose
Trustee invitation	“You have been invited to serve as a trustee for a Portfolio Immortalized account.”	Explain the invitation and direct the recipient to authenticated acceptance.
Upload complete	“Your new item has been saved securely to your vault.”	Confirm that the upload finished successfully.
Security change	“A security setting on your account has changed. Review activity if this was not you.”	Help the owner spot unexpected changes.
Inactivity review	“We need to complete a routine account-status review. Please open the app or contact support.”	Prompt safe follow-up without declaring death.
Trustee action	“A case connected to an account where you are a trustee needs your review.”	Direct a trustee to the protected portal.
Release case update	“A review involving your legacy plan has changed status. Sign in to see details.”	Avoid putting sensitive case facts in an email preview.

Communication principles

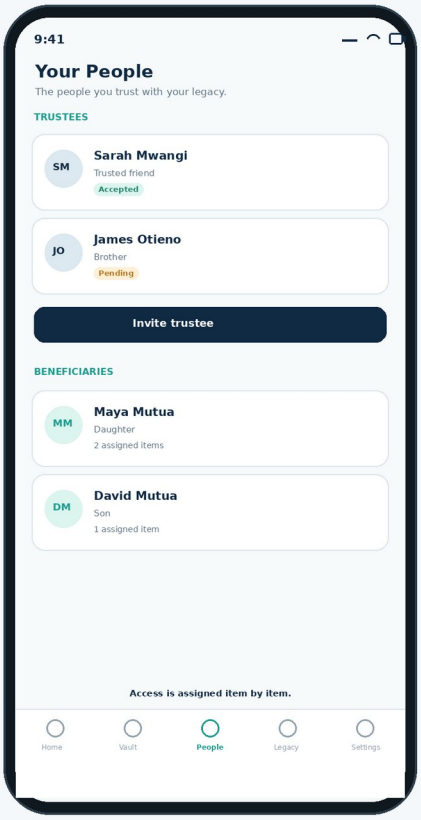

- Use email and in-app notifications for routine events, with optional push notifications where the user consents.
- Use stronger verification for sensitive links; do not put documents, passwords or decryption keys in messages.
- Retry failed delivery and show the actual delivery state to administrators.
- Allow users to select permissible notification channels, while retaining essential security and release-process notices.
- Keep messages neutral so the lock screen does not reveal sensitive family or legal information.

19 / DESIGNED FOR MOBILE FIRST

Mobile at the centre. Web when it helps.

07 Security and profile settings

08 Manage trusted people

Mobile application

The main experience is designed for Android and iOS. It prioritizes quick navigation, camera scanning, video recording, biometric app unlock, upload progress, clear network recovery and accessible text sizes.

Supporting web experience

A responsive Next.js web app supports account access and document organization, as well as a fuller trustee portal, beneficiary portal and desktop-oriented administrator console. The web and mobile apps use the same underlying account, permissions and case rules.

Consistent across devices

A user should see the same vault, relationships and current case status whichever supported device they use. A responsive design does not mean that every role sees the same screens or permissions.

20 / ADDITIONAL FEATURES

Features that make the platform more complete

Feature	Why it matters
Version history	Distinguishes an original will from later versions and shows which version is designated for release.
Recovery readiness	Lets users review recovery contacts and methods before access is lost.
Granular recipient rules	Assigns each item to specific recipients rather than releasing the whole vault indiscriminately.
Secure export and watermarking	Creates controlled, traceable copies for authorized recipients while preserving the original.
Dispute and emergency hold	Stops a release when an owner response, conflicting evidence or suspected fraud needs review.
Device management	Lists active sessions or trusted devices and lets users revoke access after loss or compromise.
Backup and restoration checks	Supports continuity if storage, database or infrastructure fails.
Accessible design	Supports readable text, screen readers, clear errors and people with different levels of digital confidence.
Multilingual readiness	Allows expansion to additional languages after the first supported language set is agreed.
Support and guided setup	Helps users complete key steps without needing to understand technical details.

21 / DELIVERY ROADMAP

Build in stages, prove the safeguards

Stage	Focus	Outcome
01. Foundation	Product decisions, design system, account flows, access model, key recovery and release policy.	Approved architecture and tested security assumptions.
02. Core mobile and web	Sign-up, profile, navigation, vault metadata, people management and core responsive screens.	Users can create accounts and organize their legacy plan.
03. Secure uploads	Document picker, camera scanning, media capture, protected storage, integrity and upload recovery.	Users can save and verify their items reliably.
04. Trusted network	Invitations, acceptance, recipient assignment, role permissions and instructions.	Trustees and beneficiaries can participate within clear boundaries.
05. Verification and admin	Inactivity escalation, cases, evidence review, alerts, holds, independent approvals and audit.	Controlled release workflow and operational visibility.
06. AI and hardening	Approved AI assistance, security testing, privacy review, recovery drills and store readiness.	A launch candidate with evidence of readiness.

Measures of readiness

- Users cannot access another account's files by changing a URL or identifier.
- No inactivity-only route can release confidential materials.
- An emergency hold can prevent new access grants and is recorded in the audit history.
- Account recovery and post-death key recovery have been tested, not just documented.
- Uploads recover from interruption and clearly show success or failure.
- Every release is traceable to the required evidence and independent approvals.

22 / STAKEHOLDER DISCUSSION

Decisions to confirm before launch

Some choices depend on legal advice, risk appetite, target launch jurisdictions and provider terms. They should be recorded and agreed rather than left to be decided informally during implementation.

Decision	What needs to be agreed
Legal scope	Which jurisdictions are supported at launch, and how will the platform describe storage versus legal will preparation/validity?
Death evidence	Which official records or independent confirmations may be accepted in each jurisdiction?
Safety hold	What hold period applies, what happens if the owner responds, and how are disputes escalated?
Release approvals	Which cases require two-person approval, and who is eligible to serve as each approver?
Encryption and recovery	How are file keys protected, recovered and released after death without creating a single-person bypass?
Storage providers	Which provider handles confidential documents and media, where is data processed, and what are retention terms?
AI data policy	Which tasks may use Gemini or Claude, what data may be sent, and how are results retained and reviewed?
Retention and deletion	How long are files, case evidence and audit records retained, including after account closure?
Pricing and limits	What storage quotas, video limits, premium tiers or support options are planned?
Launch boundary	Which features are required for the first public release and which follow later?

Recommendation

Approve the sensitive-data and release policies before final UI sign-off. The screens should explain a settled process, not commit the business to rules that are still undecided.

23 / WALKTHROUGH CHECKLIST

A five-minute product walkthrough

This sequence can be used in a presentation or discussion with interested parties. It demonstrates the product without requiring the audience to understand its technical implementation.

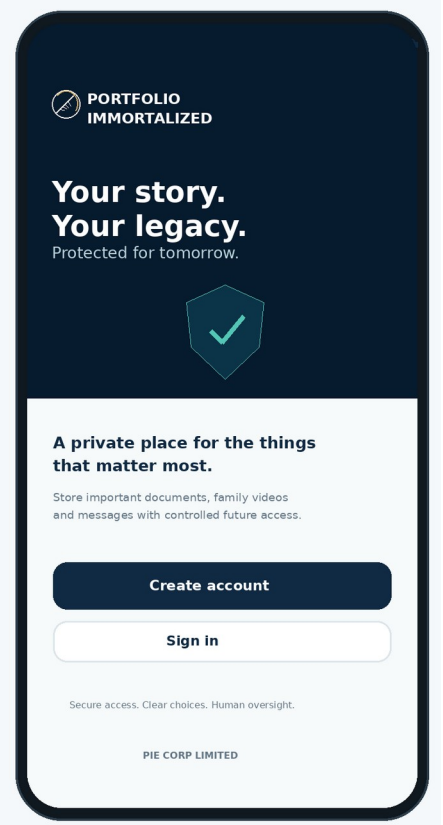

Minute	Show	Key message
1	Welcome and dashboard	Starting is easy. The user can build their plan over time.
2	Vault and upload	A user can upload a signed will, scan paper pages or record a private video.
3	Trustees and beneficiaries	The account holder chooses trusted people and assigns items deliberately.
4	Verification and admin	Inactivity starts a review. Trustees and administrators work through evidence and safeguards.
5	AI and security	AI helps organize and explain; people and explicit access rules control sensitive outcomes.

Questions to ask the audience

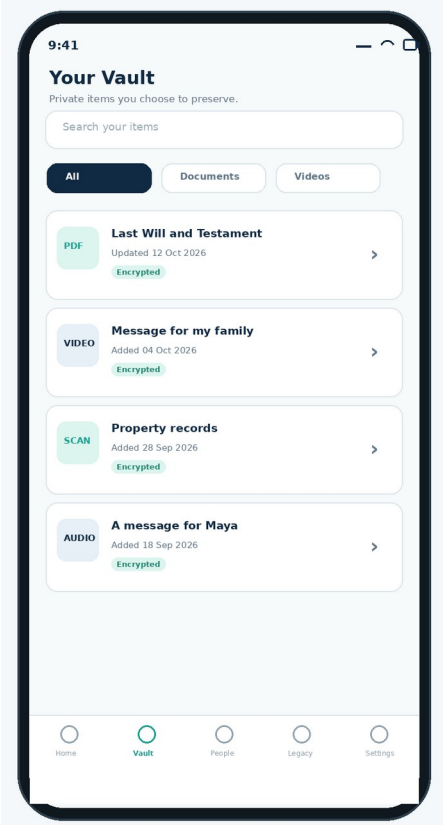

- Does the main journey feel understandable for someone who is not technically confident?
- Which types of documents and personal messages are most important to preserve?
- What level of control should a user have over recipients and item-level instructions?
- Which trustee and administrator safeguards would build the greatest trust?
- What should be included at launch, and what could follow in a later release?

24 / UI CONCEPT GALLERY

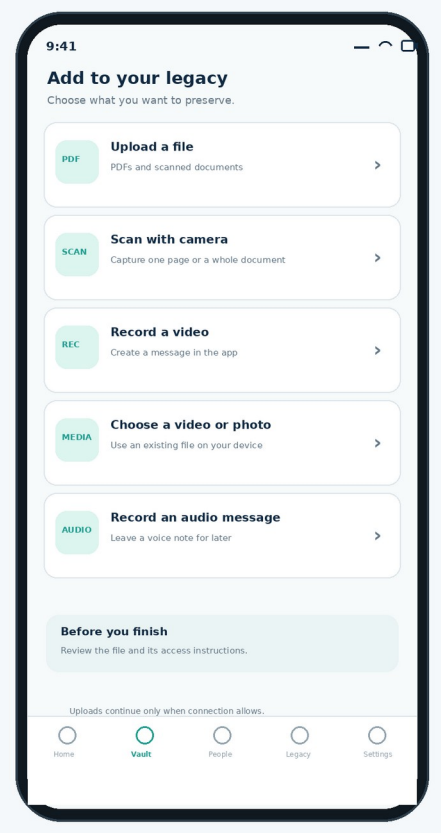

A consistent, calm visual language

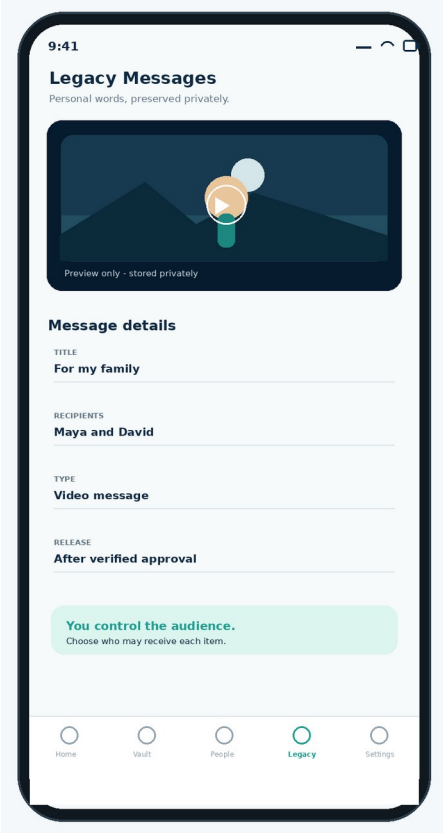

Welcome

Vault

Upload and capture

Legacy messages

These mockups communicate layout direction and sample functionality. They are not final production screens: copy, navigation, accessibility review, platform-specific behaviour and high-fidelity design details will be refined during product design.

A simple mobile navigation model

Destination	Primary content
Home	Security status, recent activity, setup checklist and important notices.
Vault	Documents, scans, photos, videos, audio and saved legacy items.
People	Trustees, beneficiaries, invitations, statuses and item assignments.
Legacy	Personal messages, future instructions and recipient-specific content.
Settings	Profile, login methods, device access, recovery, notifications, privacy and support.

Role-specific web spaces

Web area	Primary purpose
Owner web experience	Manage profile and legacy items where a larger screen is useful.
Trustee portal	Respond to case requests, provide evidence and record confirmations.
Beneficiary portal	Verify identity and securely access assigned items after authorization.
Admin console	Manage accounts, review alerts, oversee case workflows and operate the service.

Different access, consistent rules

The web and mobile apps are different windows into the same service. Role permissions and release safeguards must remain consistent across both.

26 / WHAT SUCCESS LOOKS LIKE

A trusted experience, measured in outcomes

Outcome	Possible measure
People finish setup	Completion rate for profile, recovery and trusted-network steps.
Items are stored reliably	Successful upload rate, upload retry success and low file-integrity error rate.
The network is ready	Trustee invitation acceptance and beneficiary contact-verification rate.
Users stay informed	Successful delivery of essential security and case notifications.
Cases are handled responsibly	Time to acknowledge cases, percentage with complete checklists and recorded decisions.
Unauthorized access is prevented	Results from cross-account authorization tests and periodic security assessments.
Recoverability is real	Successful restoration and key-recovery exercises under documented scenarios.
AI is helpful without overreach	User feedback and task accuracy, alongside privacy incidents and inappropriate-output tracking.

The intended result

Portfolio Immortalized should help people feel organized and prepared, while giving families a clearer route to the materials intended for them. For Pie Corp Limited, the product should be operated with transparency, accountable human oversight and security controls that are designed around the sensitivity of the information being preserved.

Portfolio Immortalized

Your story. Your legacy. Protected for tomorrow.

27 / CLOSING NOTES

A concept built around care and control

The proposed platform brings together private document storage, personal media, a trusted network and a deliberately cautious release process. Its success depends on making the everyday tasks simple while treating exceptional access as a serious, reviewable decision.

Terms used in this guide

Term	Plain-language meaning
Legacy item	A document, video, photograph, audio note or other material saved in the vault.
Trustee	A person invited to help with an assigned verification or review process.
Beneficiary	A person intended to receive one or more specified legacy items.
Inactivity signal	A lack of recent qualifying account activity; not proof of death.
Verification case	A documented workflow for reviewing evidence, notifications, holds and decisions.
Release authorization	The set of required approvals that permits access to assigned items.
AI assistance	A generated suggestion, summary or classification that must not be treated as a final authority for sensitive actions.

Planning note

This product blueprint describes intended experience and proposed safeguards for discussion. Final legal terms, evidence rules, retention policies, provider arrangements and cryptographic key-recovery procedures must be reviewed and approved before the service is launched.
